Abstract

The main aim of this paper is to use the notion \hat{f} -pre -g -openness, which was introduced in [1]. To offered new classes of separation axioms in ideal spaces. So, we offered new type of notions of convergence in ideal spaces via the \hat{f} -pre -g -open set. Relations among several types of separation axioms that offered were explained.

Keyword: Ideal, separation axioms, \hat{f} -pre -g -open set, \hat{f} -pre -g -closed set, \hat{f} -pre -g -Convergent, \hat{f} -pre -g -open function, \hat{f} -pre -g -cotinuous function.

1. Introduction

In 1933, Kuratowski [2]. Presented the concept of ideals on non-empty sets. A collection $\hat{f} \subset \mathcal{P}(X)$ is namely an ideals on a nonempty set X , when the following two conditions are met; (i) $B \in \hat{f}$ whenever $B \subset A$ and $A \in \hat{f}$, and (ii) $A \cup B \in \hat{f}$ whenever A and B are belong to \hat{f} . Vaidyanathaswamy [3]. Had offered for initial the idea of ideal spaces by introduced the set operator $(\)^*: \mathcal{P}(X) \rightarrow \mathcal{P}(X)$, namely local function. So he founded new generalize of the topological spaces, namely ideal space and symbolizes by $(X, \mathcal{T}, \hat{f})$, [4, 5].

The concept of "pre-open set" was introduced by Mashhour, Abd El- Monsef and El-Deeb, a set A in (X, \mathcal{T}) is a pre-open when $A \subseteq \text{cl}(\text{int}(A))$ [6]. From that time many researchers have submitted many studies in this field [7-9]. Latterly, Ahmed and Esmaeel [1]. had submitted the concept of \hat{f} -pre -g -closed set (simply, \hat{f} pg-closed) A set A in $(X, \mathcal{T}, \hat{f})$ is \hat{f} pg-closed, if the condition $A - \mathcal{U} \in \hat{f}$ and \mathcal{U} is pre-open set, implies to $\text{cl}(A) - \mathcal{U} \in \hat{f}$. So, the set A in X is namely \hat{f} -pre -g -open set (simply, \hat{f} pg-open), if $X - A$ is \hat{f} pg-closed. The collection of all \hat{f} pg-closed set (respectively, \hat{f} pg-open set) in $(X, \mathcal{T}, \hat{f})$ simply \hat{f} pg-C(X) (respectively, \hat{f} pg-O(X)). For a space $(X, \mathcal{T}, \hat{f})$, \hat{f} pg-O(X) is finer than \mathcal{T} [1]. The main target of this article is to introduce new kinds of separation axioms in ideal spaces by using the notion \hat{f} pg-open set.

2. \hat{f} -Pre-g -separation axioms

This portion is to submit new classes of separation axioms by using the notion of \hat{f} pg-openness. Properties of these sorts are studied and the relations between it are discussed.also.

Definition 2.1: A space $(X, \mathbb{T}, \mathfrak{f})$ is namely \mathfrak{f} -pre-g- \mathbb{T}_0 -space (frugally, \mathfrak{f} pg- \mathbb{T}_0 -space) if for each elements $r_1 \neq r_2$, there exist an \mathfrak{f} pg-open set containing only one of them.

When (X, \mathbb{T}) is \mathbb{T}_0 -space, it will lead to that $(X, \mathbb{T}, \mathfrak{f})$ is \mathfrak{f} pg- \mathbb{T}_0 -space for any ideal \mathfrak{f} on X .

Remark 2.2: For a space $(X, \mathbb{T}, \mathfrak{f})$, the below sentences are rewards;

- i. $(X, \mathbb{T}, \mathfrak{f})$ Is an \mathfrak{f} pg- \mathbb{T}_0 -space.
- ii. For each element $r_1 \neq r_2$, there is an \mathfrak{f} pg-closed set containing only one of them.

Definition 2.3: A space $(X, \mathbb{T}, \mathfrak{f})$ is namely \mathfrak{f} -pre-g- \mathbb{T}_1 -space (frugally, \mathfrak{f} pg- \mathbb{T}_1 -space) if for each elements $r_1 \neq r_2$, there are \mathfrak{f} pg-open sets \mathbb{U}_1 and \mathbb{U}_2 , satisfies $(r_1 \in \mathbb{U}_1 - \mathbb{U}_2)$ and $(r_2 \in \mathbb{U}_2 - \mathbb{U}_1)$.

When (X, \mathbb{T}) is \mathbb{T}_1 -space, it will lead to that $(X, \mathbb{T}, \mathfrak{f})$ is \mathfrak{f} pg- \mathbb{T}_1 -space, for any ideal \mathfrak{f} on X .

Remark 2.4: If X is \mathfrak{f} pg- \mathbb{T}_1 -space, implies that \mathfrak{f} pg- \mathbb{T}_0 -space.

The inverse meaning implied in Remark 2.4, does not valid, in general.

Example 2.5: A space $(X, \mathbb{T}, \mathfrak{f})$ is a \mathfrak{f} pg- \mathbb{T}_0 -space where $X = \{r_1, r_2, r_3\}$, $\mathbb{T} = \{X, \emptyset, \{r_1\}\}$ and $\mathfrak{f} = \{\emptyset, \{r_2\}\}$. The space $(X, \mathbb{T}, \mathfrak{f})$ is not \mathfrak{f} pg- \mathbb{T}_1 -space, since for the elements $r_1 \neq r_3$, there is no \mathfrak{f} pg-open set \mathbb{U} containing r_3 which does not contain r_1 .

Remark 2.6: For a space $(X, \mathbb{T}, \mathfrak{f})$, the below sentences are rewards;

- i. $(X, \mathbb{T}, \mathfrak{f})$ Is an \mathfrak{f} pg- \mathbb{T}_1 -space.
- ii. For each elements $r_1 \neq r_2$, there are two \mathfrak{f} pg-closed sets F_1 and F_2 , such that $(r_1 \in F_1 - F_2)$ and $(r_2 \in F_2 - F_1)$.

Remark 2.7: If $\{r\}$ is \mathfrak{f} pg-closed set for each r in X , then $(X, \mathbb{T}, \mathfrak{f})$ is \mathfrak{f} pg- \mathbb{T}_1 -space.

Definition 2.8: A space $(X, \mathbb{T}, \mathfrak{f})$ is namely \mathfrak{f} -pre-g- \mathbb{T}_2 -space (frugally, \mathfrak{f} pg- \mathbb{T}_2 -space), if for each elements $r_1 \neq r_2$, there are disjoint \mathfrak{f} pg-open sets \mathbb{U}_1 and \mathbb{U}_2 satisfies $r_1 \in \mathbb{U}_1$ and $r_2 \in \mathbb{U}_2$.

Clearly; if (X, \mathbb{T}) is \mathbb{T}_2 -space implicate that $(X, \mathbb{T}, \mathfrak{f})$ is \mathfrak{f} pg- \mathbb{T}_2 -space, for any ideal \mathfrak{f} on X .

Remark 2.9: If the space $(X, \mathbb{T}, \mathfrak{f})$ is \mathfrak{f} pg- \mathbb{T}_2 -space then it is \mathfrak{f} pg- \mathbb{T}_1 -space.

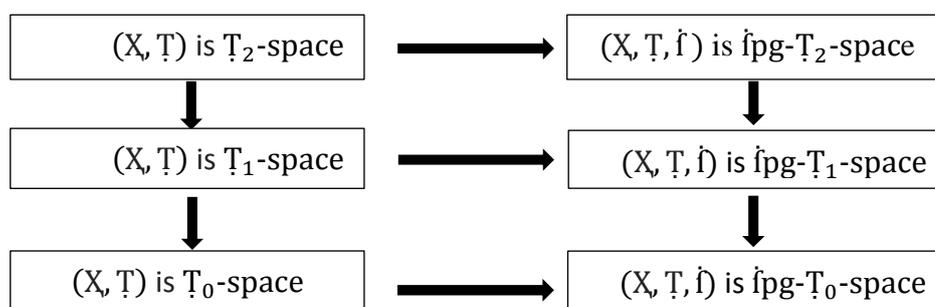

The inverse meaning implied in Remark 2.9, does not valid, in general.

Example 2.10: The \mathfrak{f} pg- \mathbb{T}_1 -space $(X, \mathbb{T}, \mathfrak{f})$; such that $X = \{r_1, r_2, r_3\}$, $\mathbb{T} = \{X, \emptyset\}$ and $\mathfrak{f} = \{\emptyset, \{r_1\}, \{r_2\}, \{r_1, r_2\}\}$ is not \mathfrak{f} pg- \mathbb{T}_2 -space. Since, for the elements $r_1 \neq r_3$, there are no disjoint \mathfrak{f} pg-open sets \mathbb{U}_1 and \mathbb{U}_2 such that $r_1 \in \mathbb{U}_1$ and $r_3 \in \mathbb{U}_2$.

Remark 2.11: For a space $(X, \mathbb{T}, \mathfrak{f})$, the below sentences are rewards;

- i. $(X, \mathbb{T}, \mathfrak{f})$ is an \mathfrak{f} pg- \mathbb{T}_2 -space.
- ii. For each elements $r_1 \neq r_2$, there are disjoint \mathfrak{f} pg-closed sets F_1 and F_2 , satisfies $r_1 \in F_1$ and $r_2 \in F_2$.

We have the truth that confirms that if (X, \mathbb{T}) is a \mathbb{T}_i -space ($i = 0, 1$ and 2), then the ideal space $(X, \mathbb{T}, \mathfrak{f})$ is a \mathfrak{f} pg- \mathbb{T}_i -space. But the inverse meaning implied may be invalid, as shown in the following diagram.

Example Below shows the relationships between the unlike classes of notions that presented previously.

Example 2.12: The $\hat{f}pg\text{-}\mathbb{T}_i$ -space (X, \mathbb{T}, \hat{f}) where $X = \{r_1, r_2, r_3\}$, $\mathbb{T} = \{X, \emptyset\}$ and $\hat{f} = \mathcal{P}(X)$ is not \mathbb{T}_i -space (where $i = 0, 1$ and 2).

3. Separation axioms by using some types of function

In this part, we will using some types of functions that we were offered it in Ahmed and Esmaeel [1]. And study the notions of new separation axioms under influence of these functions.

Definition 3.1: [1]. A function $f : (X, \mathbb{T}, \hat{f}) \rightarrow (Y, \mathbb{U}, j)$ is

- i. \hat{f} -pre-g-open function, symbolizes $\hat{f}pgo$ -function, if $f(\mathbb{U})$ is jpg -open set in Y whenever \mathbb{U} is $\hat{f}pg$ -open set in X .
- ii. \hat{f}^* -pre-g-open function, symbolizes \hat{f}^*pgo -function, if $f(\mathbb{U})$ is jpg -open set in Y whenever \mathbb{U} is open set in X .
- iii. \hat{f}^{**} -pre-g-open function, symbolizes $\hat{f}^{**}pgo$ -function, if $f(\mathbb{U})$ is open in Y whenever \mathbb{U} is $\hat{f}pg$ -open set in X .

Proposition 3.2: If (X, \mathbb{T}, \hat{f}) is an $\hat{f}pg\text{-}\mathbb{T}_0$ -space (respectively, $\hat{f}pg\text{-}\mathbb{T}_1$ -space and $\hat{f}pg\text{-}\mathbb{T}_2$ -space) and $f : (X, \mathbb{T}, \hat{f}) \rightarrow (Y, \mathbb{U}, j)$ is surjective, $\hat{f}pgo$ -function then (Y, \mathbb{U}, j) is $jpg\text{-}\mathbb{U}_0$ -space (respectively, $jpg\text{-}\mathbb{U}_1$ -space and $jpg\text{-}\mathbb{U}_2$ -space).

Proof: Since $f(\mathbb{U})$ is jpg -open in Y whenever \mathbb{U} is $\hat{f}pg$ -open set in X .

Proposition 3.3: If a space (X, \mathbb{T}) is \mathbb{T}_0 -space (respectively, \mathbb{T}_1 -space and \mathbb{T}_2 -space) and $f : (X, \mathbb{T}, \hat{f}) \rightarrow (Y, \mathbb{U}, j)$ is surjective, \hat{f}^*pgo -function then (Y, \mathbb{U}, j) is $jpg\text{-}\mathbb{U}_0$ -space (respectively, $jpg\text{-}\mathbb{U}_1$ -space and $jpg\text{-}\mathbb{U}_2$ -space).

Proof: Since $f(\mathbb{U})$ is jpg -open set in Y whenever \mathbb{U} is open in X .

Proposition 3.4: If a space (X, \mathbb{T}, \hat{f}) is $\hat{f}pg\text{-}\mathbb{T}_0$ -space (respectively, $\hat{f}pg\text{-}\mathbb{T}_1$ -space and $\hat{f}pg\text{-}\mathbb{T}_2$ -space) and $f : (X, \mathbb{T}, \hat{f}) \rightarrow (Y, \mathbb{U}, j)$ is surjective, $\hat{f}^{**}pgo$ -function then (Y, \mathbb{U}) is \mathbb{U}_0 -space (respectively, \mathbb{U}_1 -space and \mathbb{U}_2 -space).

Proof: Since $f(\mathbb{U})$ is open in Y whenever \mathbb{U} is $\hat{f}pg$ -open set in X .

Remark 3.5: If $f : (X, \mathbb{T}) \rightarrow (Y, \mathbb{U})$ is a bijective open function and a space (X, \mathbb{T}) is a \mathbb{T}_0 -space (respectively, \mathbb{T}_1 -space and \mathbb{T}_2 -space), then the space (Y, \mathbb{U}, j) is a $jpg\text{-}\mathbb{U}_0$ -space (respectively, $jpg\text{-}\mathbb{U}_1$ -space and $jpg\text{-}\mathbb{U}_2$ -space), for any ideal j on Y .

Definition 3.6: [2]. A function $f : (X, \mathbb{T}, \hat{f}) \rightarrow (Y, \mathbb{U}, j)$ is;

- i. \hat{f} -pre-g-continuous function, symbolizes $\hat{f}pg$ -continuous, if $f^{-1}(v) \in \hat{f}pgO(X)$ for all $v \in \mathbb{U}$.
- ii. Strongly- \hat{f} -pre-g-continuous function, Symbolizes strongly- $\hat{f}pg$ -continuous, if $f^{-1}(v) \in \mathbb{T}$, for all $v \in jpgO(Y)$.
- iii. \hat{f} -pre-g-irresolute function, symbolizes $\hat{f}pg$ -irresolute, if $f^{-1}(v) \in \hat{f}pgO(X)$ for all $v \in jpgO(Y)$.

Proposition 3.7: If (Y, \mathbb{U}) is \mathbb{T}_0 -space (respectively, \mathbb{T}_1 -space and \mathbb{T}_2 -space) and $f : (X, \mathbb{T}, \hat{f}) \rightarrow (Y, \mathbb{U}, j)$ is injective, $\hat{f}pg$ -continuous function, then (X, \mathbb{T}, \hat{f}) is an $\hat{f}pg\text{-}\mathbb{T}_0$ -space (respectively, $\hat{f}pg\text{-}\mathbb{T}_1$ -space and $\hat{f}pg\text{-}\mathbb{T}_2$ -space).

Proof: Since $f^{-1}(v) \in \hat{f}pgO(X)$ for all $v \in \mathbb{U}$.

Corollary 3.8: If a space (Y, \mathbb{U}) is \mathbb{T}_0 -space (respectively, \mathbb{T}_1 -space and \mathbb{T}_2 -space) and $f : (X, \mathbb{T}, \hat{f}) \rightarrow (Y, \mathbb{U}, j)$ is injective, continuous function then (X, \mathbb{T}, \hat{f}) is an $\hat{f}pg\text{-}\mathbb{T}_0$ -space (respectively, $\hat{f}pg\text{-}\mathbb{T}_1$ -space and $\hat{f}pg\text{-}\mathbb{T}_2$ -space).

Proof: Clearly, the continuity leads to $\hat{f}pg$ -continuity [2]. So Proposition 3.7 is valid.

Proposition 3.9: If $(Y, \mathcal{T}, \mathcal{I})$ is $\mathcal{I}\text{-}\mathcal{T}_0$ -space (respectively, $\mathcal{I}\text{-}\mathcal{T}_1$ -space and $\mathcal{I}\text{-}\mathcal{T}_2$ -space) and $f : (X, \mathcal{T}, \mathcal{I}) \rightarrow (Y, \mathcal{T}, \mathcal{I})$ is injective, strongly- $\mathcal{I}\text{-}\mathcal{T}$ -continuous then the space (X, \mathcal{T}) is \mathcal{T}_0 -space (respectively, \mathcal{T}_1 -space and \mathcal{T}_2 -space).

Proof: follows by the result $f^{-1}(v) \in \mathcal{T}$, for all $v \in \mathcal{I}\text{-}\mathcal{O}(Y)$.

Proposition 3.10: If a space $(Y, \mathcal{T}, \mathcal{I})$ is a $\mathcal{I}\text{-}\mathcal{T}_0$ -space (respectively, $\mathcal{I}\text{-}\mathcal{T}_1$ -space and $\mathcal{I}\text{-}\mathcal{T}_2$ -space) and $f : (X, \mathcal{T}, \mathcal{I}) \rightarrow (Y, \mathcal{T}, \mathcal{I})$ is an injective, $\mathcal{I}\text{-}\mathcal{T}$ -irresolute function, then $(X, \mathcal{T}, \mathcal{I})$ is an $\mathcal{I}\text{-}\mathcal{T}_0$ -space (respectively, $\mathcal{I}\text{-}\mathcal{T}_1$ -space and $\mathcal{I}\text{-}\mathcal{T}_2$ -space).

Proof: follows by the result if $f^{-1}(v) \in \mathcal{I}\text{-}\mathcal{O}(X)$ for all $v \in \mathcal{I}\text{-}\mathcal{O}(Y)$.

4. On $\mathcal{I}\text{-}\mathcal{T}$ -convergence

In this part we will use the notion $\mathcal{I}\text{-}\mathcal{T}$ -openness to erection some class of convergence in ideal spaces namely $\mathcal{I}\text{-}\mathcal{T}$ -convergence. So, the action of some sorts of functions are discussed like, $\mathcal{I}\text{-}\mathcal{T}$ -open function, $\mathcal{I}\text{-}\mathcal{T}$ -continuous-function, $\mathcal{I}\text{-}\mathcal{T}$ -irresolute-function and strongly- $\mathcal{I}\text{-}\mathcal{T}$ -continuous function [1].

Definition 4.1: Let $(X, \mathcal{T}, \mathcal{I})$ be an ideal space, $x \in X$ and $(\delta_n)_{n \in \mathbb{N}}$ be a sequence in X . Then $(\delta_n)_{n \in \mathbb{N}}$ is namely $\mathcal{I}\text{-}\mathcal{T}$ -convergence to x (frugally, $\delta_n \rightsquigarrow x$) if for every $\mathcal{I}\text{-}\mathcal{T}$ -open set \mathcal{U} contained x_0 , $\exists k \in \mathbb{N}$ such that $\delta_n \in \mathcal{U} \forall n \geq k$.

A sequence $(\delta_n)_{n \in \mathbb{N}}$ is namely $\mathcal{I}\text{-}\mathcal{T}$ -divergence if it is not $\mathcal{I}\text{-}\mathcal{T}$ -convergence.

Proposition 4.2: If $(X, \mathcal{T}, \mathcal{I})$ is $\mathcal{I}\text{-}\mathcal{T}_2$ -space then every $\mathcal{I}\text{-}\mathcal{T}$ -convergence sequence in X has a unique limit point.

Proof: Let $(\delta_n)_{n \in \mathbb{N}}$ be a sequence in X where $\delta_n \rightsquigarrow x$ and $\delta_n \rightsquigarrow \zeta$; $x \neq \zeta$ where $x, \zeta \in X$. Since $(X, \mathcal{T}, \mathcal{I})$ is $\mathcal{I}\text{-}\mathcal{T}_2$ -space, then $\exists \mathcal{U}, \mathcal{V} \in \mathcal{I}\text{-}\mathcal{O}(X)$ such that $x \in \mathcal{U}$ and $\zeta \in \mathcal{V}$, where $\mathcal{U} \cap \mathcal{V} = \emptyset$. Since $\delta_n \rightsquigarrow x$ and $x \in \mathcal{U} \in \mathcal{I}\text{-}\mathcal{O}(X)$ leads to $\exists k_1 \in \mathbb{N}$; $\delta_n \in \mathcal{U} \forall n \geq k_1$. So $\delta_n \rightsquigarrow \zeta$ and $\zeta \in \mathcal{V} \in \mathcal{I}\text{-}\mathcal{O}(X)$ leads to $\exists k_2 \in \mathbb{N}$; $\delta_n \in \mathcal{V} \forall n \geq k_2$. Hence, $\mathcal{U} \cap \mathcal{V} \neq \emptyset$, that is contradiction.

The precondition that a space X is $\mathcal{I}\text{-}\mathcal{T}_2$ -space is very requisite to make Proposition 4.2, is valid.

Example 4.3: For a space $(X, \mathcal{T}, \mathcal{I})$ where $X = \{x_1, x_2, x_3\}$, $\mathcal{T} = \{X, \emptyset\}$ and $\mathcal{I} = \{\emptyset\}$.

Obviously; the sequence $(\delta_n)_{n \in \mathbb{N}}$ in X , where $\delta_n = x_1$ for all n , has three limit points; that $\delta_n \rightsquigarrow x_1$, $\delta_n \rightsquigarrow x_2$ and $\delta_n \rightsquigarrow x_3$.

In mathematics, convergence sequence was an important subject [10, 11]. The following proposition explains the relationships between convergence and $\mathcal{I}\text{-}\mathcal{T}$ -convergence to x_0 .

Proposition 4.4: If a sequence $(\delta_n)_{n \in \mathbb{N}}$ is $\mathcal{I}\text{-}\mathcal{T}$ -convergence to x_0 in $(X, \mathcal{T}, \mathcal{I})$, then it is convergence to x_0 .

Proof: Since every open set in $(X, \mathcal{T}, \mathcal{I})$ is $\mathcal{I}\text{-}\mathcal{T}$ -open, then the proof is over.

The meaningfulness in Proposition 4.4, cannot be inverting, in general.

Example 4.5: For a space $(X, \mathcal{T}, \mathcal{I})$, where $X = \mathbb{N}$ set of all natural numbers, $\mathcal{T} = \{X, \emptyset\}$ and $\mathcal{I} = \mathcal{P}(X)$. The sequence $(\delta_n)_{n \in \mathbb{N}}$, where $\delta_n = n \forall n \in \mathbb{N}$, is convergence to $n = 1$ which is not $\mathcal{I}\text{-}\mathcal{T}$ -convergence.

Proposition 4.6: Let $f : (X, \mathcal{T}, \mathcal{I}) \rightarrow (Y, \mathcal{T}, \mathcal{I})$ be $\mathcal{I}\text{-}\mathcal{T}$ -irresolute function and $(\delta_n)_{n \in \mathbb{N}}$ be a sequence in X . If $\delta_n \rightsquigarrow x_0$ in X , then $f(\delta_n) \rightarrow f(x_0)$ in Y .

Proposition 4.7: Let $f : (X, \mathcal{T}, \mathcal{I}) \rightarrow (Y, \mathcal{T}, \mathcal{I})$ be $\mathcal{I}\text{-}\mathcal{T}$ -continuous function and $(\delta_n)_{n \in \mathbb{N}}$ be a sequence in X . If $\delta_n \rightsquigarrow x_0$ in X , then $f(\delta_n) \rightarrow f(x_0)$ in Y .

Proposition 4.8: Let $f : (X, \mathcal{T}, \hat{f}) \rightarrow (Y, \mathcal{U}, j)$ be strongly- \hat{f} sg-continuous function and $(\delta_n)_{n \in \mathbb{N}}$ be a sequence in X . If $\delta_n \rightsquigarrow x_0$ in X , then $f(\delta_n) \rightarrow f(x_0)$ in Y .

5. Conclusion

The notion \hat{f} -pre-g-openness, was use to offered new classes of separation axioms and new type of convergence in ideal spaces. Some relations and examples among several types of separation axioms that offered were explained.
